Description: SoundGraffiti  
allow us to play in real time  
via the MIDI an instrument,  
or play an image.

SoundGraffiti allow us to  
stop, play or edit tempo,  
note, key, tone color... All  
without the display  
(framebuffer) screen. The  
sound of a note is recorded  
in a buffer and is displayed  
after the next note.

SoundGraffiti not define  
color, it display the notes  
(image) in color. If you hit

the 'E' key of your keyboard,  
an instrument will start  
playing. SoundGraffiti is  
available in English,  
Japanese, French,  
Portuguese, Dutch, German,  
Spanish, Russian, Polish,  
and Hungarian languages.  
SoundGraffiti can be used  
for presentations, live,  
screencast,... A soft synth is  
a software synthesizer.  
SoundGraffiti can provide  
visual help for musicians,  
other musicians or sound-  
artists. Most soft synth are

---

able to play the music sounds. But for visualizations, it has no purpose. These soft synth also have a graphical interface, with many icons, but as a musician (or sound-artist) are not useful.

SoundGraffiti is a soft synth for sound visualization.

SoundGraffiti as well as other visual instruments can be added to your Jamtrack, or included in any music, or can be performed as performance. Keyboard

macro, which is a feature of most soft synth, are not useful for visualization. You can also record what you are doing, that is useful.

Examples are available in Audio2Midi project:  
Audio2Midi: Audio2Midi a fork of the Csound project that allows to play and record audio directly in csound files or external program. SoundGraffiti is a plugin and/or fork of Audio2Midi. How does it work? 1. SoundGraffiti in

real time SoundGraffiti is a  
real time visualization tool.  
Music is played in real time.

The sound is 'recorded' on  
buffer. In real time, the play  
of the instrument is  
synchronized to the sound of  
the buffer. The sound of a  
note is stored into buffer  
after the next note. The  
instrument was replaced by a  
picture of a note. 2. Notes  
SoundGraffiti show the  
notes of music with a color  
picture of a note. 3

1. Get SoundGraffiti plugin for your favorite operating system. 2. Open ‘settings’. This way you will be able to personalize your visualization settings. 3. Select ‘visualizer’ tab. 4. Choose a visualizer plugin among the listed. You can switch between visualizers by clicking ‘switch’. 5. Click ‘start’. 6. First time, after processing data, you will be

---

able to see an image of  
sound on the visualizer.

After that, the image will  
change until the end of the  
music. 7. You can record a

video with the images of  
sound. 8. You can repeat  
visualization settings for

each file. [?][?][?][?]: 1. [?][?][?][?][?][?]

Diabetes mellitus (DM) is a major public health problem in Puerto Rico and has been investigated in great detail in the mainland United States. Little information is available for the island. The purpose of this study was to compare the clinical and epidemiologic characteristics of DM in Puerto Rico with those of the mainland United States.

SoundGraffiti is a plugin that allows you visualize images. SoundGraffiti contains my own algorithm of digital processing of a signal. The algorithm not universal, especially since tastes may differ. Therefore, you may personalize the

visualization settings. I may be available for a demo, if you would like to know SoundGraffiti as an end user. Features:

SoundGraffiti allows you visualize an image or a sequence of images as a unique combination of a sequence of unique sounds.

It sounds like a solo in a guitar. SoundGraffiti have 3 main visualization modes: movie, continuous motion, and stop motion.

SoundGraffiti movie mode:

---

To understand how SoundGraffiti visualization could help you to understand, please read the following: The SoundGraffiti movie mode generates a special type of visualization where a sequence of images is mapped onto a sequence of sounds. The mapping is not based on any projection, but on a simple digital processing. In an abstract visualization of visual images, a person must

---

distinguish the visual elements, such as objects, people, landscapes. How a person does this, I do not know. But it is probably a combination of different sensory modalities such as vision, hearing, and touch. All these sensory modalities are connected to various parts of the brain. This is the theory of how our brain works. It is assumed that the signal of the human brain is similar to the signal of the digital processor. What a

---

person sees is a sequence of images. What he or she hears is a sequence of sounds. The same can be said about other senses. And is this sequence of sound sounds to this sequence of images, the person imagines. This is the result of the imagination. But it can be said that the brain is reacting to the image by listening to the sequence of sounds. The brain is reacting to the sound by watching the sequence of images. The Signal

---

Processing Algorithm in SoundGraffiti The algorithm of signal processing is similar to the algorithm of the perception of the human brain. The algorithm is based on the idea of creating an artificial music for the visualization. The idea is to transform the sequence of images in the sequence of sounds. The algorithm for processing an audio signal is called Algorithm 01. You will need to have an understanding of sound

---

waves and sound frequencies to understand how the algorithm works. The sequence of sounds is mapped into a sequence of images. However, the images are very simple images, such as bars and lines. For a better understanding of the visualization, please read the following: The sound sequence is processed through a function that I call the simple function. The output of this function is a

---

sequence of simple images,  
a bar or line for each sound.  
This bar or line sequence is  
transformed into a sequence  
of complex images. This  
sequence is transformed  
again, this time into a  
sequence of
